

Quickfit Panel System

Furnace Roofs

By using the innovative FCS Quickfit Panel system we are able to offer our customers quality monolithic Low Thermal Mass linings with considerable time and energy savings compared to that of traditional dense refractory roofs.

The detachable design of the panels allows for up to 60m² to be installed in one day. A typical 20m long furnace roof can be installed in less than 1 week.

Reducing downtime results in greater productivity.

Maintenance times are greatly reduced as individual panels can be quickly removed to allow heat to escape and to gain internal access.

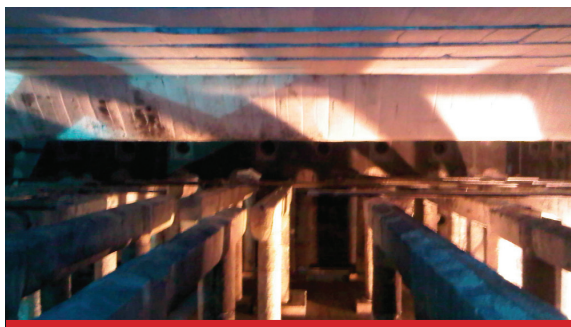

The system can be tailor-made to meet specific customer requirements.

Internally contoured profiles allowing for the inclusion of separate heating zones within the furnace, ensuring optimum temperature profile.

The system is not susceptible to thermal shock and light-up times are significantly reduced compared with dense refractory.

The FCS Quickfit System has been used within the steel industry for over 30 years and is tried and tested. It is guaranteed to be successful.
